QUEZON CITY UNIVERSITY

COLLEGE OF COMPUTER STUDIES

SE101 – SOFTWARE ENGINEERING
[FINALS] ASSIGNMENT 1

NAME: Villete, Leonardo Enrico B.

STUDENT NO: 24-1523

YEAR/SECTION: SBIT-2F

DATE: 4/11/2026

SCORE	PERCENTAGE

INSTRUCTIONS:

Answer the following questions and elaborate your answer. In your own words. (10 pts each)

1. Why is the software design process important before coding? (in your own words)

- Because in order to build something, you must first create a plan on how to build it. Software Design Process refers to a phase in software development where requirements gathered through analysis, are transformed into a technical blueprint that defines how the system will be built, structured, and implemented. This is important because it makes the whole development process less vague and more organized.

2. What is the difference between interface design and architectural design?

- Architectural design is concerned with the internal organization and stability of the project. It defines the overall structure of the system, the main modules, and how they interact with one another. Interface design is the specification of the interaction between a system and its environment. It focuses on how the information is exchanged between the software and the entire world.

3. Explain the role of User Interface in system development.

- User interface is what defines the relationship between an End-user and a Digital System, while the back-end manages data and processing, the UI is the only part of the system the user actually sees and interacts with. The interface is what allows users to control the system and navigate the information they want to see.
